

New York City

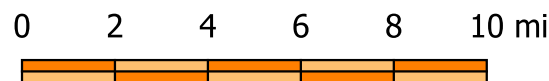

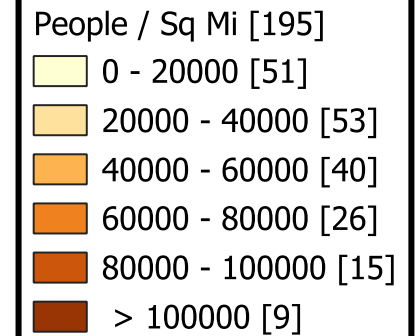

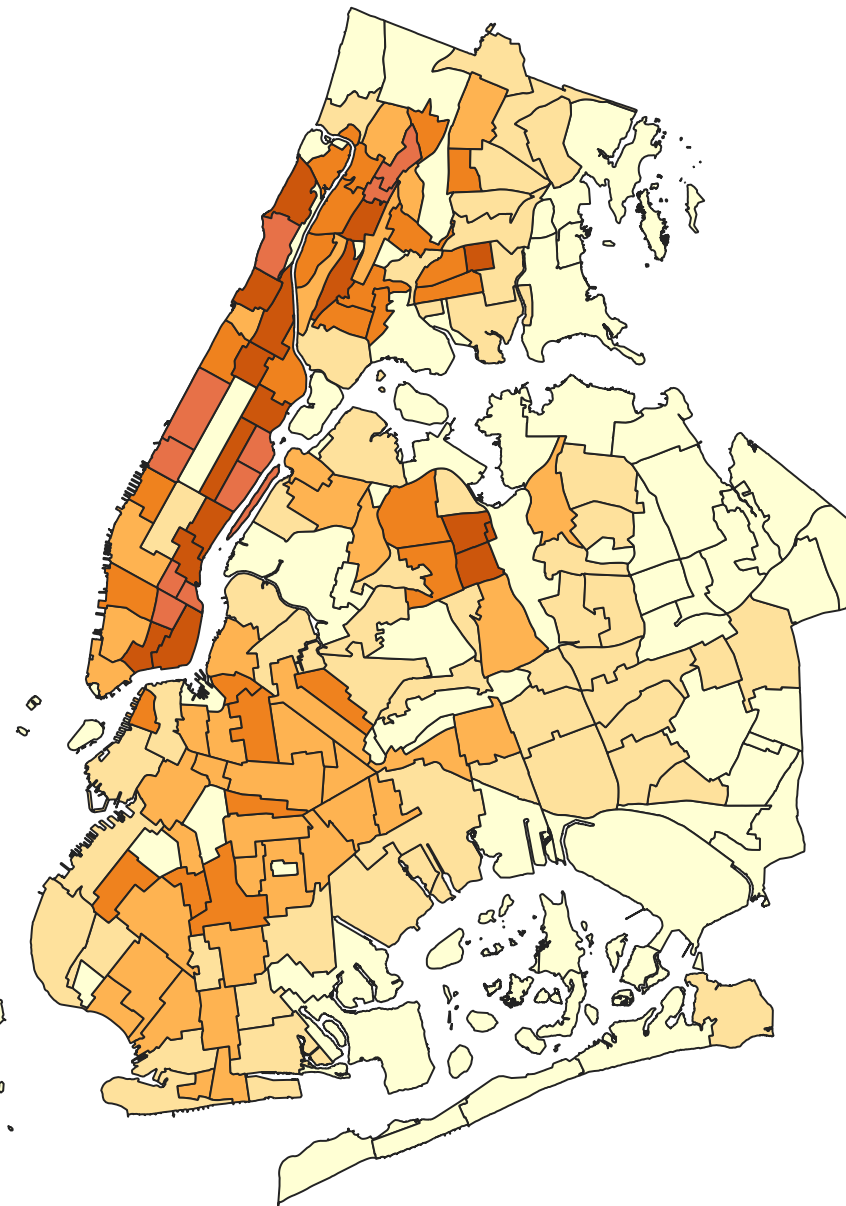

Population Density

2010

This map shows population density (people per square mile) for New York City Neighborhood Tabulation Areas (NTAs) in 2010.

NTAs are medium-sized statistical areas used for reporting Decennial Census and American Community Survey (ACS) statistics, and their boundaries broadly align with commonly recognized neighborhoods.

In 2010, nine NTAs recorded densities above 100,000 people per square mile, concentrated in Manhattan and the Bronx.
